

ET26-Intro

visual world paradigm

The eyeconics:
Mayuri Mudaliar
Feixiang Xiao
Tara Mrithula Ramasamy
Jonathan Klenk

Original Paper: Altmann et al. ^[1]

The boy will **eat**/move
the cake.
(toy car, ball, toy train).

Extension Idea: Compare Predictions of **Humans** and **Large Language models**

„Are the prediction probabilities of Large Language Models on Subsequent references similarly distributed to probabilities estimated with human anticipatory eye movements in a Visual World Paradigm? “

H1: In the **restrictive verb** condition (e.g., "eat"), both human anticipatory gaze probabilities and LLM **target noun probabilities** will be **high**
→ alignment expected

H2: In the **neutral verb** condition (e.g., "move"), both human anticipatory gaze probabilities and LLM target noun probabilities will be **equally distributed** amongst objects
→ alignment expected'
